
Vinuprakash Sivanantham

vinu.prakash050@gmail.com / 9994292890 / Hyderabad, Telangana

Summary

Full Stack Developer with 3+ years of experience building scalable web applications using **React.js, Node.js, SQL, REST APIs, and Redux**. Strong background in developing responsive UI, creating backend services, integrating APIs, and managing secure data flows. Experienced working on enterprise platforms involving dashboards, real-time monitoring, adaptors, connectors, and incident management modules. Known for problem-solving, clean coding, and effective collaboration in agile teams.

Education and Training

Sona College of Technology

Bachelor of Engineering (B.E.): Computer Science and Engineering (05/2018 - 06/2022)

CGPA : 8.3

Experience

L&T Technology Services Ltd. - Full stack developer

12/2022 - Current

Hyderabad, Telangana

- As a full stack developer, I work on both frontend and backend modules using React.js, Node.js, JavaScript, SQL, and REST APIs
 - I develop scalable, responsive UI components and integrate them with backend services to deliver end-to-end features
 - My role involves building API endpoints, handling CRUD operations, optimizing database queries, and ensuring smooth communication between frontend and backend
 - I focus on performance optimization, secure data handling, and maintaining consistent user experience across devices and browsers
 - I have a proven track record of delivering full-stack features on time, managing small teams, and collaborating effectively with designers, testers, and backend developers
 - Skills: React.js, Node.js, SQL, JavaScript (ES6+), API Integration, Time Management, Team Collaboration
-

Skillset

Frontend: React.js, JavaScript (ES6+), HTML, CSS, Redux, Context API

Backend: Node.js, Express.js, SQL, REST APIs

Real-Time: WebSocket's, Kafka (Event-driven systems)

Security: RBAC, CryptoJS

Visualization: Recharts.js, Maps API

Tools: Git, GitHub, Axios

DevOps: Deployment coordination, environment setup

Projects

- TC4 Smart Building Web Application
- Fusion 2.0 – Enterprise Operations & Monitoring Platform
- Fusion Worlds – Web & Mobile Platform

TC4 Smart Building Web Application

Role: Full Stack Developer / Frontend Engineer

Technologies: React.js, Redux, Node.js, Express, SQL, REST APIs, Recharts.js, Azure AD, CryptoJS

Project Overview

- TC4 Smart Building is a **centralized building management and analytics platform** designed to **monitor, analyze, and optimize smart building operations** in real time. The system aggregates data from multiple building subsystems such as **parking management, air quality sensors (AQI), energy systems, and facility monitoring services**.
- The platform provides:
- **Unified dashboards** for facility managers and administrators
- **Real-time monitoring screens** for live building status
- **Analytical reports and visual insights** to support operational and management decisions
- **Secure role-based access** for different user types (admins, operators, managers)

Key Contributions

- Developed **end-to-end smart building modules** including dashboards, monitoring screens, and analytics views.
- Built **15+ reusable, modular UI components** and integrated them with backend services.
- Implemented **Azure AD authentication** and **role-based access control (RBAC)** across the application.
- Integrated **REST APIs** for real-time building data such as **parking availability, AQI levels, and hourly reports**.
- Created **dynamic charts and dashboards** using **Recharts.js** for interactive data visualization.
- Secured sensitive data using **Triple DES (CryptoJS)** and ensured safe transmission of user credentials.
- Managed **global state using Redux + Context API** for high-complexity application modules.
- Ensured **fully responsive layouts** using **Flexbox, CSS Grid, and media queries**.
- Collaborated with the team using **Git/GitHub** for version control, code reviews, and release management.

Fusion 2.0 – Enterprise Operations & Monitoring Platform

Role: Full Stack Developer

Technologies: React.js, Node.js, Express.js, SQL, REST APIs, WebSockets, Maps API

- Developed core modules for Fusion 2.0 including adaptors, connectors, real-time incident monitoring, and schedule-driven workflows
- Created adaptor/connector UI screens to configure data pipelines between multiple systems
- Built scheduler screens to manage automated jobs, triggers, and system tasks
- Developed Incident Management screens enabling users to report, track, assign, and close incidents with real-time updates
- Implemented map-based visualizations to display incident locations, device positions, and system alerts
- Built backend APIs to support incident logging, metadata handling, and status tracking
- Improved system performance through optimized SQL queries and efficient API structuring
- Integrated WebSocket's for real-time alerts, status updates, and monitoring
- Worked closely with testing and DevOps teams to ensure stable releases and proper versioning

Contributions

- Implemented **role-based access control**, Azure AD login, and secure credential handling using **Triple DES (CryptoJS)**
- Integrated **REST APIs** for real-time data (parking, AQI, reports) using Axios/Fetch
- Developed **dynamic dashboards** and charts using Recharts.js
- Managed complex state using **Redux + Context API**
- Ensured **mobile-first responsiveness** using Flexbox, Grid, Media Queries
- Performed debugging and optimization using **Chrome DevTools** and **React DevTools**
- Used **Git/GitHub** for version control and team collaboration

Fusion Worlds – Web & Mobile Platform

Role: Full Stack Developer / Backend & Web Lead

Technologies: React.js, Redux, Node.js, Express.js, SQL, REST APIs, WebSockets, Kafka, Event Mesh, DevOps Pipelines

Project Overview

- Fusion Worlds is a **real-time, AI-powered incident management platform** designed for city-scale operations and command centers (ICCC). The system continuously **collects data from field sensors and devices** to detect incidents such as **accidents, traffic congestion, and abnormal events**.
- When an incident is detected, the system:
- Sends the event data to an **LLM-based AI agent** for **context-aware analysis**
- Receives **intelligent insights and recommended actions**
- Displays the incident in a **central ICCC operator dashboard** for monitoring and control
- The platform provides:
- An **ICCC Operator Web Application** to monitor incidents, analyze AI recommendations, and **assign officers/resources**
- A **Field Officer Mobile Application** where officers can **accept tasks, update status, and close incidents**

Key Contributions

- Developed the **entire web application frontend** using React.js and Redux with scalable architecture and modular components.
- Designed and implemented **backend APIs used by BOTH web and mobile applications**, handling core business logic and data flow.
- Built **secure, scalable REST APIs** supporting multi-client consumption (web + mobile).
- Implemented **Redux-based global state management** for complex workflows and high-interaction UI screens.
- Integrated **WebSockets for real-time updates and live system events** across the platform.
- Implemented **Kafka-based publish/subscribe event-driven architecture** using an **Event Mesh** for asynchronous communication between services.
- Worked on **system setup and deployment pipeline configuration** in close collaboration with DevOps, including:
 - Web application environment setup
 - Build & deployment workflow coordination
 - Environment configuration and release support
- Worked closely with **DevOps and infrastructure teams** to ensure stable deployments, scalability, and system monitoring.
- Optimized backend performance using **efficient SQL queries, API structuring, and asynchronous processing**.
- Ensured **high availability and real-time responsiveness** of the platform through event-driven architecture and real-time communication channels.
